PAPER

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Office Action Summary

Application No.

10/526,750

Applicant(s)

PFERDEKAEEMPER ET AL.

Examiner

AARON SANDERS

Art Unit

2168

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 17 June 2008.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-9, 11, 12 and 15-31 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-9, 11, 12 and 15-31 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 07 March 2005 is/are: a) ☐ accepted or b) ☒ objected to by the Examiner.
- Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
- Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☒ Information Disclosure Statement(s) (PTO/SB/US)
Paper No(s)/Mail Date 07/21/2008 and 08/26/2008
- 4) ☐ Interview Summary (PTO-413)
Paper No(s)/Mail Date _____
- 5) ☐ ~~Notice of Informal Patent Application~~
- 6) ☐ Other: _____

DETAILED ACTION

Response to Amendment

The amendment filed 17 June 2008 has been entered. Claims 1-9, 11-12, and 15-31 are pending. Claims 1, 11-12, and 15-23 are currently amended. Claims 10 and 13-14 are cancelled. No claims are new. This action is FINAL, as necessitated by amendment.

Double Patenting

Claims 1, 3-4, 11-12, 16-17, 23, and 25-26 of this application conflict with claims 1-6, 8-13, 15-20, and 22-25 of Application No. 10/656,208. 37 CFR 1.78(b) provides that when two or more applications filed by the same applicant contain conflicting claims, elimination of such claims from all but one application may be required in the absence of good and sufficient reason for their retention during pendency in more than one application. Applicant is required to either cancel the conflicting claims from all but one application or maintain a clear line of demarcation between the applications. See MPEP § 822.

The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the “right to exclude” granted by a patent and to prevent possible harassment by multiple assignees. A nonstatutory obviousness-type double patenting rejection is appropriate where the conflicting claims are not identical, but at least one examined application claim is not patentably distinct from the reference claim(s) because the examined application claim is either anticipated by, or would have been obvious over, the reference claim(s). See, e.g., *In re Berg*, 140 F.3d 1428, 46 USPQ2d 1226 (Fed. Cir. 1998); *In re*

Goodman, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Ornum*, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970); and *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) or 1.321(d) may be used to overcome an actual or provisional rejection based on a nonstatutory double patenting ground provided the conflicting application or patent either is shown to be commonly owned with this application, or claims an invention made as a result of activities undertaken within the scope of a joint research agreement.

Effective January 1, 1994, a registered attorney or agent of record may sign a terminal disclaimer. A terminal disclaimer signed by the assignee must fully comply with 37 CFR 3.73(b).

Claims 1, 3-4, 11-12, 16-17, 23, and 25-26 are provisionally rejected on the ground of nonstatutory obviousness-type double patenting as being unpatentable over claims 1-6, 8-13, 15-20, and 22-25 of copending Application 10/656,208. Although the conflicting claims are not identical, they are not patentably distinct from each other because independent claims 1, 8, 15, and 22 of 10/656,208 are broader (i.e. fewer limitations of the same invention) than independent claims 1, 11, 12, and 23 of 10/526,750. While some of the claim terms are not the same (e.g. “checking” instead of “determining” and “granting access” instead of “performing the read and/or write access”), the functionality is the same. Thus, it would have been obvious to one of ordinary skill in the art that the fewer limitations and slightly different language of 10/656,208 would read on the method, system, and computer readable storage medium of 10/526,750.

Claims Comparison Table	
10/526,750	10/656,208
1	1, 2, 6
3	3, 4
4	5
11	8, 9, 13
12	15, 16, 20
16	17, 18
17	19
23	22
25	10, 11, 23
26	12, 24, 25

This is a provisional obviousness-type double patenting rejection because the conflicting claims have not in fact been patented.

Drawings

The drawings are objected to under 37 CFR 1.83(a). The drawings must show every feature of the invention specified in the claims. Therefore, the method of claims 1 and 12 must be shown or the feature(s) canceled from the claim(s). No new matter should be entered.

Corrected drawing sheets in compliance with 37 CFR 1.121(d) are required in reply to the Office action to avoid abandonment of the application. Any amended replacement drawing

sheet should include all of the figures appearing on the immediate prior version of the sheet, even if only one figure is being amended. The figure or figure number of an amended drawing should not be labeled as “amended.” If a drawing figure is to be canceled, the appropriate figure must be removed from the replacement sheet, and where necessary, the remaining figures must be renumbered and appropriate changes made to the brief description of the several views of the drawings for consistency. Additional replacement sheets may be necessary to show the renumbering of the remaining figures. Each drawing sheet submitted after the filing date of an application must be labeled in the top margin as either “Replacement Sheet” or “New Sheet” pursuant to 37 CFR 1.121(d). If the changes are not accepted by the examiner, the applicant will be notified and informed of any required corrective action in the next Office action. The objection to the drawings will not be held in abeyance.

Claim Objections

As per claims 1, 12, and 23, it is unclear how the limitation “a data object having the ID being stored in a first storage location” relates to “storing an identifier (ID) in a second lock object.” They appear to be independent limitations, but the wording is unclear.

Claim Rejections - 35 USC § 112, First Paragraph

The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

Claims 1, 11, 12, and 23 are rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the written description requirement. The claims contains subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventors, at the time the application was filed, had possession of the claimed invention. Specifically, the specification does not mention “displaying... whether the read and/or write access... can be performed.”

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-9, 11-12, and 15-31 are rejected under 35 U.S.C. 103(a) as being unpatentable over Lenz, U.S. 5,566,319, in view of Lakhamraju et al., U.S. 6,343,296.

1. Lenz teaches “*A method comprising*,” see col. 1, line 66 – col. 2, line 23, “a method of controlling access to data in storage which data and storage are shared by a plurality of processors.”

Lenz teaches “*storing an identifier (ID) in a second lock object*,” see Fig. 3, where the claimed “second lock object” is the referenced array of “Shared Data Record[s]” for “006”, “007”, “008”, etc.

Lenz teaches “*determining whether the ID is contained in a first lock object*,” see Fig. 3 and col. 3, lines 1-10, “By using the search key ‘007’ during the execution of the lock

instruction, the part of the lock file containing the control field for record 007 is addressed for writing” where the claimed “first lock object” is the referenced “Lock-File” 3-1.

Lenz teaches “*and if the link is assigned to the ID, skipping performing a read and/or write access on the data object,*” see Fig. 3 and col. 5, lines 51-55, “SKC could be 1: block not empty (at least one control field not empty), i.e. an access right may only be granted after detailed examination” where “SKC” means “status identification code.”

Lenz teaches “*and if the link is not assigned to the ID,*” see Fig. 4 and col. 4, line 34 – col. 5, line 3, “access rights are withdrawn in steps 4-8, 4-9 and 4-10 (the unlock instruction is carried out), i.e. a new ZVI is entered in the lock file” where “ZVI” means “access administration information.” Lenz also teaches “*deleting the ID from the first lock object,*” see e.g. Fig. 4 and col. 4, line 34 – col. 5, line 3, “the status identification code is updated accordingly in step 4-10, for example, to the effect that the control field is now empty and may be overwritten without having to be read later on.” Lenz further teaches “*and performing the read and/or write access on the data object,*” see Fig. 3 and col. 5, lines 49-50, “SKC could be 0: block empty (all control fields empty), i.e. an access right may be granted immediately.”

Lenz teaches “*and if the ID is not contained in the first lock object, performing the read and/or write access on the data object,*” see Fig. 3 and col. 3, lines 51-62, “If the examination of the status identification code SKC shows that the write operation into the control field for account record 007, refer to 3-2 for instance, may be executed, this write operation is carried out and the status identification code SKC is updated according to the write request.”

Lenz teaches “*and displaying to a user, on an output display, whether the read and/or write access on the data object is skipped or can be performed,*” see Fig. 6 and col. 5, line 60 –

col. 6, line 7, “FIG. 6 is a schematic time diagram illustrating how two processors at different times access a record addressable by the key ‘007’ for executing a read instruction.”

Lenz does not teach “*a data object having the ID being stored in a first storage location in a computer system.*” Lakhamraju does, however, see col. 4, lines 40-47, “concurrency may be further improved by locking a migrating object one at a time... Thereafter, the migrating object is relocated and released.” Thus, it would have been obvious to one of ordinary skill in the database art at the time of the invention to combine the teachings of the cited references because Lakhamraju’s teachings would have allowed Lenz’s method to gain “online reorganization allowing as many concurrent transactions as possible,” see col. 3, line 66 – col. 4, line 10.

Lenz does not teach “*if the ID is contained in the first lock object, determining whether a link to a second storage location having a copy of the data object is assigned to the ID in the first lock object.*” Lakhamraju does, however, see Fig. 7 and col. 9, lines 40-45, “With the migrating object locked, each parent to that object is locked, one at a time, block 702, updated with the new location, block 703, and released, block 704,” where the claimed “first lock object” is the referenced “parent” and the claimed “link” is the referenced “location.” Thus, it would have been obvious to one of ordinary skill in the database art at the time of the invention to combine the teachings of the cited references because Lakhamraju’s teachings would have allowed Lenz’s method to gain “online reorganization allowing as many concurrent transactions as possible,” see col. 3, line 66 – col. 4, line 10.

2. Lenz teaches “*The method of claim 1, wherein the first lock object is a file stored on a nonvolatile storage means,*” see Fig. 3 and col. 1, line 66 – col. 2, line 23, “Each of the

processors has a local main storage. The shared storage is located outside of the main storage and stores a lock file.”

3. Lenz teaches “*The method of claim 1, wherein the first lock object comprises a table having a first column for the ID and a second column for the link of the ID to the second storage location,*” see Fig. 3, “Lock-File” 3-1.

4. Lenz teaches “*The method of claim 1, wherein each data object comprises one or more fields of one or more tables and wherein the ID comprises one or more key fields of the one or more tables,*” see Fig. 5.

5. Lenz teaches “*The method of claim 4, wherein the link is a filename or a link to a file,*” see Fig. 3 and col. 1, line 66 – col. 2, line 23, “Each of the control fields is associated with a corresponding data address.”

6. Lenz teaches “*The method of claim 1, wherein the first lock object is created by a data moving process,*” see col. 1, line 66 – col. 2, line 23, “a method of controlling access to data in storage which data and storage are shared by a plurality of processors.”

7. Lenz teaches “*The method of claim 1, wherein the second lock object is stored in a volatile storage means,*” see Fig. 3 and col. 1, line 66 – col. 2, line 23, “Each of the processors has a local main storage. The shared storage is located outside of the main storage and stores a lock file.”

8. Lenz teaches “*The method of claim 1, wherein the second lock object is a data array,*” see Fig. 3, the array of “Shared Data Record[s]” for “006”, “007”, “008”, etc.

9. Lenz teaches “*The method of claim 8 wherein the data array is one dimensional,*” see Fig. 3, the array of “Shared Data Record[s]” for “006”, “007”, “008”, etc.

11. Lenz teaches “*A computer system for processing data, comprising: memory means for storing program instructions,*” see Fig. 3, “Local Main Storage 1” 3-6.

Lenz teaches “*input means for entering data,*” see Fig. 3, “Writing.”

Lenz teaches “*storage means for storing data,*” see Fig. 3, shared storage 3-9.

Lenz teaches “*a processor responsive to the program instructions, wherein the program instructions comprise program code means for performing a method for accessing a data object having an identifier (ID) and stored in a first storage location,*” see Fig. 3 and col. 1, line 66 – col. 2, line 23, “a method of controlling access to data in storage which data and storage are shared by a plurality of processors.”

Lenz teaches “*the method comprising: storing the ID in a second lock object,*” see Fig. 3, where the claimed “second lock object” is the referenced array of “Shared Data Record[s]” for “006”, “007”, “008”, etc.

Lenz teaches “*determining whether the ID is contained in a first lock object,*” see Fig. 3 and col. 3, lines 1-10, “By using the search key ‘007’ during the execution of the lock instruction, the part of the lock file containing the control field for record 007 is addressed for writing,” where the claimed “first lock object” is the referenced “Lock-File” 3-1.

Lenz teaches “*if the link is assigned to the ID, skipping performing a read and/or write access on the data object,*” see Fig. 3 and col. 5, lines 51-55, “SKC could be 1: block not empty (at least one control field not empty), i.e. an access right may only be granted after detailed examination,” where “SKC” means “status identification code.”

Lenz teaches “*and if the link is not assigned to the ID,*” see Fig. 4 and col. 4, line 34 – col. 5, line 3, “access rights are withdrawn in steps 4-8, 4-9 and 4-10 (the unlock instruction is

carried out), i.e. a new ZVI is entered in the lock file.” Lenz teaches “*deleting the ID from the first lock object*,” see Fig. 4 and col. 4, line 34 – col. 5, line 3, “the status identification code is updated accordingly in step 4-10, for example, to the effect that the control field is now empty and may be overwritten without having to be read later on.” Lenz teaches “*and performing the read and/or write access on the data object*,” see Fig. 3 and col. 5, lines 49-50, “SKC could be 0: block empty (all control fields empty), i.e. an access right may be granted immediately.”

Lenz teaches “*and if the ID is not contained in the first lock object, performing the read and/or write access on the data object*,” see Fig. 3 and col. 3, lines 51-62, “If the examination of the status identification code SKC shows that the write operation into the control field for account record 007, refer to 3-2 for instance, may be executed, this write operation is carried out and the status identification code SKC is updated according to the write request.”

Lenz teaches “*and displaying to a user, on an output display, whether the read and/or write access on the data object is skipped or can be performed*,” see Fig. 6 and col. 5, line 60 – col. 6, line 7, “FIG. 6 is a schematic time diagram illustrating how two processors at different times access a record addressable by the key ‘007’ for executing a read instruction.”

Lenz does not teach “*if the ID is contained in the first lock object, determining whether a link to a second storage location having a copy of the data object is assigned to the ID in the first lock object*.” Lakhmraju does, however, see Fig. 7 and col. 9, lines 40-45, “With the migrating object locked, each parent to that object is locked, one at a time, block 702, updated with the new location, block 703, and released, block 704,” where the claimed “first lock object” is the referenced “parent” and the claimed “link” is the referenced “location.” Thus, it would have been obvious to one of ordinary skill in the database art at the time of the invention to combine

the teachings of the cited references because Lakhamraju's teachings would have allowed Lenz's method to gain "online reorganization allowing as many concurrent transactions as possible," see col. 3, line 66 – col. 4, line 10.

12. Lenz teaches "*A computer readable storage medium comprising instructions for performing a method comprising,*" see col. 1, line 66 – col. 2, line 23, "a method of controlling access to data in storage which data and storage are shared by a plurality of processors."

Lenz teaches "*storing an identifier (ID) in a second lock object,*" see Fig. 3, where the claimed "second lock object" is the referenced array of "Shared Data Record[s]" for "006", "007", "008", etc.

Lenz teaches "*determining whether the ID is contained in a first lock object,*" see Fig. 3 and col. 3, lines 1-10, "By using the search key '007' during the execution of the lock instruction, the part of the lock file containing the control field for record 007 is addressed for writing" where the claimed "first lock object" is the referenced "Lock-File" 3-1.

Lenz teaches "*and if the link is assigned to the ID, skipping performing a read and/or write access on the data object,*" see Fig. 3 where, see col. 5, lines 51-55, "SKC could be 1: block not empty (at least one control field not empty), i.e. an access right may only be granted after detailed examination."

Lenz teaches "*and if the link is not assigned to the ID,*" see Fig. 4 and col. 4, line 34 – col. 5, line 3, "access rights are withdrawn in steps 4-8, 4-9 and 4-10 (the unlock instruction is carried out), i.e. a new ZVI is entered in the lock file." Lenz teaches "*deleting the ID from the first lock object,*" see Fig. 4 and col. 4, line 34 – col. 5, line 3, "the status identification code is updated accordingly in step 4-10, for example, to the effect that the control field is now empty

and may be overwritten without having to be read later on.” Lenz teaches “*and performing the read and/or write access on the data object,*” see Fig. 3 and col. 5, lines 49-50, “SKC could be 0: block empty (all control fields empty), i.e. an access right may be granted immediately.”

Lenz teaches “*and if the ID is not contained in the first lock object, performing the read and/or write access on the data object,*” see Fig. 3 and col. 3, lines 51-62, “If the examination of the status identification code SKC shows that the write operation into the control field for account record 007, refer to 3-2 for instance, may be executed, this write operation is carried out and the status identification code SKC is updated according to the write request.”

Lenz teaches “*and displaying to a user, on an output display, whether the read and/or write access on the data object is skipped or can be performed,*” see Fig. 6 and col. 5, line 60 – col. 6, line 7, “FIG. 6 is a schematic time diagram illustrating how two processors at different times access a record addressable by the key ‘007’ for executing a read instruction.”

Lenz does not teach “*if the ID is contained in the first lock object, determining whether a link to a second storage location having a copy of the data object is assigned to the ID in the first lock object.*” Lakhamraju does, however, see Fig. 7 and col. 9, lines 40-45, “With the migrating object locked, each parent to that object is locked, one at a time, block 702, updated with the new location, block 703, and released, block 704,” where the claimed “first lock object” is the referenced “parent” and the claimed “link” is the referenced “location.” Thus, it would have been obvious to one of ordinary skill in the database art at the time of the invention to combine the teachings of the cited references because Lakhamraju’s teachings would have allowed Lenz’s method to gain “online reorganization allowing as many concurrent transactions as possible,” see col. 3, line 66 – col. 4, line 10.

15. Lenz teaches “*The computer readable storage medium of claim 12, wherein the first lock object is a file stored on a nonvolatile storage means,*” see Fig. 3 and col. 1, line 66 – col. 2, line 23, “Each of the processors has a local main storage. The shared storage is located outside of the main storage and stores a lock file.”

16. Lenz teaches “*The computer readable storage medium of claim 12, wherein the first lock object comprises a table having a first column for the ID and a second column for the link of the ID to the second storage location,*” see Fig. 3, “Lock-File” 3-1.

17. Lenz teaches “*The computer readable storage medium of claim 12, wherein each data object comprises one or more fields of one or more tables and wherein the ID comprises one or more key fields of the one or more tables,*” see Fig. 5.

18. Lenz teaches “*The computer readable storage medium of claim 12, wherein the link is a filename or a link to a file,*” see Fig. 3 and col. 1, line 66 – col. 2, line 23, “Each of the control fields is associated with a corresponding data address.”

19. Lenz teaches “*The computer readable storage medium of claim 12, wherein the first lock object is created by a data moving process,*” see col. 1, line 66 – col. 2, line 23, “a method of controlling access to data in storage which data and storage are shared by a plurality of processors.”

20. Lenz teaches “*The computer readable storage medium of claim 12, wherein the second lock object is stored in a volatile storage means,*” see Fig. 3 and col. 1, line 66 – col. 2, line 23, “Each of the processors has a local main storage. The shared storage is located outside of the main storage and stores a lock file.”

21. Lenz teaches *“The computer readable storage medium of claim 12, wherein the second lock object is a data array,”* see Fig. 3, the array of “Shared Data Record[s]” for “006”, “007”, “008”, etc.

22. Lenz teaches *“The computer readable storage medium of claim 21, wherein the data array is one dimensional,”* see Fig. 3, the array of “Shared Data Record[s]” for “006”, “007”, “008”, etc.

23. Lenz teaches *“A computer system comprising,”* see Fig. 3 and col. 1, line 66 – col. 2, line 23, “a method of controlling access to data in storage which data and storage are shared by a plurality of processors.”

Lenz teaches *“a processor responsive to program instructions,”* see Fig. 3 and col. 1, line 66 – col. 2, line 23, “a method of controlling access to data in storage which data and storage are shared by a plurality of processors.”

Lenz teaches *“means for storing an identifier (ID) in a second lock object,”* see Fig. 3, where the claimed “second lock object” is the referenced array of “Shared Data Record[s]” for “006”, “007”, “008”, etc.

Lenz teaches *“means for determining whether the ID is contained in a first lock object,”* see Fig. 3 and col. 3, lines 1-10, “By using the search key ‘007’ during the execution of the lock instruction, the part of the lock file containing the control field for record 007 is addressed for writing” where the claimed “first lock object” is the referenced “Lock-File” 3-1.

Lenz teaches *“and if the link is assigned to the ID, skipping performing a read and/or write access on the data object,”* see Fig. 3 and col. 5, lines 51-55, “SKC could be 1: block not

empty (at least one control field not empty), i.e. an access right may only be granted after detailed examination.”

Lenz teaches “*and if the link is not assigned to the ID,*” see Fig. 4 and col. 4, line 34 – col. 5, line 3, “access rights are withdrawn in steps 4-8, 4-9 and 4-10 (the unlock instruction is carried out), i.e. a new ZVI is entered in the lock file.” Lenz teaches “*deleting the ID from the first lock object,*” see Fig. 4 and col. 4, line 34 – col. 5, line 3, “the status identification code is updated accordingly in step 4-10, for example, to the effect that the control field is now empty and may be overwritten without having to be read later on.” Lenz teaches “*and performing the read and/or write access on the data object,*” see Fig. 3 and col. 5, lines 49-50, “SKC could be 0: block empty (all control fields empty), i.e. an access right may be granted immediately.”

Lenz teaches “*and if the ID is not contained in the first lock object, performing the read and/or write access on the data object,*” see Fig. 3 and col. 3, lines 51-62, “If the examination of the status identification code SKC shows that the write operation into the control field for account record 007, refer to 3-2 for instance, may be executed, this write operation is carried out and the status identification code SKC is updated according to the write request.”

Lenz teaches “*and an output display for displaying to a user, on an output display, whether the read and/or write access on the data object is skipped or can be performed,*” see Fig. 6 and col. 5, line 60 – col. 6, line 7, “FIG. 6 is a schematic time diagram illustrating how two processors at different times access a record addressable by the key ‘007’ for executing a read instruction.”

Lenz does not teach “*a data object having the ID being stored in a first storage location.*” Lakhamraju does, however, see col. 4, lines 40-47, “concurrency may be further improved by

locking a migrating object one at a time... Thereafter, the migrating object is relocated and released.” Thus, it would have been obvious to one of ordinary skill in the database art at the time of the invention to combine the teachings of the cited references because Lakhamraju’s teachings would have allowed Lenz’s method to gain “online reorganization allowing as many concurrent transactions as possible,” see col. 3, line 66 – col. 4, line 10.

Lenz does not teach “*if the ID is contained in the first lock object, determining whether a link to a second storage location having a copy of the data object is assigned to the ID in the first lock object.*” Lakhamraju does, however, see Fig. 7 and col. 9, lines 40-45, “With the migrating object locked, each parent to that object is locked, one at a time, block 702, updated with the new location, block 703, and released, block 704,” where the claimed “first lock object” is the referenced “parent” and the claimed “link” is the referenced “location.” Thus, it would have been obvious to one of ordinary skill in the database art at the time of the invention to combine the teachings of the cited references because Lakhamraju’s teachings would have allowed Lenz’s method to gain “online reorganization allowing as many concurrent transactions as possible,” see col. 3, line 66 – col. 4, line 10.

24. Lenz teaches “*The computer system of claim 23, wherein first lock object is a file stored on a nonvolatile storage means,*” see Fig. 3 and col. 1, line 66 – col. 2, line 23, “Each of the processors has a local main storage. The shared storage is located outside of the main storage and stores a lock file.”

25. Lenz teaches “*The computer system of claim 23, wherein the first lock object comprises a table having a first column for the ID and a second column for the link of the ID to the second storage location,*” see Fig. 3, “Lock-File” 3-1.

26. Lenz teaches “*The computer system of claim 23, wherein each data object comprises one or more fields of one or more tables and wherein the ID comprises one or more key fields of the one or more tables,*” see Fig. 5.

27. Lenz teaches “*The computer system of claim 23, wherein the link is a filename or a link to a file,*” see Fig. 3 and col. 1, line 66 – col. 2, line 23, “Each of the control fields is associated with a corresponding data address.”

28. Lenz teaches “*The computer system of claim 23, wherein the first lock object is created by a data moving process,*” see col. 1, line 66 – col. 2, line 23, “a method of controlling access to data in storage which data and storage are shared by a plurality of processors.”

29. Lenz teaches “*The computer system of claim 23, wherein the second lock object is stored in a volatile storage means,*” see Fig. 3 and col. 1, line 66 – col. 2, line 23, “Each of the processors has a local main storage. The shared storage is located outside of the main storage and stores a lock file.”

30. Lenz teaches “*The computer system of claim 23, wherein the second lock object is a data array,*” see Fig. 3, the array of “Shared Data Record[s]” for “006”, “007”, “008”, etc.

31. Lenz teaches “*The computer system of claim 30, wherein the data array is one dimensional,*” see Fig. 3, the array of “Shared Data Record[s]” for “006”, “007”, “008”, etc.

Response to Arguments

As per Applicant’s argument that the figures illustrate all the steps of the claims 1 and 12, the Examiner respectfully disagrees. While exemplary Fig. 8 may depict “if the ID is contained in the first lock object,” it does not show “determining whether a link to a second storage

location having a copy of the data object is assigned to the ID in the first lock object.” Likewise, none of the figures show the step of “displaying.”

As per Applicant’s argument that “displaying to a user, on an output display, whether the read and/or write access on the data object is skipped or can be performed” is supported by the specification as per 35 U.S.C. 112, first paragraph, the Examiner respectfully disagrees. While “whether the read and/or write access on the data object is skipped or can be performed” can be characterized as data to be displayed on an output device (Remarks p. 13), the specification does not say this. The Examiner is not arguing that nothing is displayed, rather, the specification does not recite that “whether the read and/or write access on the data object is skipped or can be performed” is displayed.

As per Applicant’s argument that Teng does not teach “if the ID is contained in the first lock object, determining whether a link to a second storage location having a copy of the data object is assigned to the ID in the first lock object,” the Examiner agrees. Lakhamraju does, however, see Fig. 7 and col. 9, lines 40-45, “With the migrating object locked, each parent to that object is locked, one at a time, block 702, updated with the new location, block 703, and released, block 704,” where the claimed “first lock object” is the referenced “parent” and the claimed “link” is the referenced “location.” Thus, it would have been obvious to one of ordinary skill in the database art at the time of the invention to combine the teachings of the cited references because Lakhamraju’s teachings would have allowed Lenz’s method to gain “online reorganization allowing as many concurrent transactions as possible,” see col. 3, line 66 – col. 4, line 10.

Conclusion

Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Aaron Sanders whose telephone number is 571-270-1016. The examiner can normally be reached on M-F 9:00a-4:00p.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Tim Vo can be reached on 571-272-3642. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
